### EDITORIAL

#### **BROTE DE ENFERMEDAD POR EL VIRUS DEL ÉBOLA – REPÚBLICA DEMOCRÁTICA DEL CONGO**

Casi un año después del fin de la última epidemia del virus Ébola vuelve a reaparecer la enfermedad en África. En esta oportunidad el brote ha ocurrido en la República Democrática del Congo, que es el país africano que más brotes de ébola ha sufrido; siendo este el octavo desde su descubrimiento en 1976. El 9 de mayo del 2017, la Organización Mundial de la Salud (OMS) fue informada sobre la presencia de un conglomerado de casos con defunciones, a causa de una enfermedad de origen desconocido con síntomas hemorrágicos en la Zona Sanitaria de Likati, en la provincia de Bas Uele en el norte de la República Democrática del Congo (RDC), fronteriza con la República Centroafricana. Este conglomerado se presentó desde abril a mayo donde se notificaron un total de nueve casos (3 de ellos mortales y 6 hospitalizados).

La OMS recomienda la aplicación de estrategias que han demostrado ser eficaces en la prevención y el control de brotes de Ébola; estas incluyen: coordinación de la respuesta, una mayor vigilancia, confirmación de los casos por laboratorio, identificación y seguimiento de contactos, manejo oportuno de casos, prevención de infecciones, entierros seguros, movilización social y compromiso con la comunidad, logística, comunicación de riesgo, investigación y movilización de recursos. Como podemos ver esta es una enfermedad emergente que nos pone en alerta nuevamente y nos sirve para valorar el nivel real de preparación de los países en cuanto a prevención, detección, manejo de casos y seguimiento de contactos según las lecciones aprendidas en epidemia por Ébola del año 2014 en África Occidental.
