La tos ferina también conocida como tos convulsiva o pertussis, es una enfermedad prevenible por vacunación, causada por la bacteria *Bordetella pertussis* que genera una infección de las vías respiratorias altas. Estas bacterias se adhieren a los cilios que recubren parte del aparato respiratorio superior, liberando toxinas que inflaman las vías respiratorias, desencadenando así la enfermedad que inicia como un resfrío común en la mayoría de los casos y luego evoluciona hacia una tos persistente e incontrolable que dificulta la respiración. Esta enfermedad es transmitida por vía aérea de persona a persona a través de las gotitas de aerosol que se emiten al estornudar o toser, por lo que es muy contagiosa (aproximadamente el 90% de los contactos susceptibles de un caso confirmado adquieren la enfermedad). La población más expuesta a riesgo está comprendida por los lactantes menores de 2 meses, ya que no se encuentran protegidos con la vacuna pentavalente (inicio del esquema de vacunación es a partir de los 2 meses de edad).

La Organización Mundial de la Salud reportó 123003 casos a nivel mundial para el año 2016, lo que representa 17% menos casos que los notificados en el 2015. Al ser tos ferina una enfermedad inmunoprevenible, la vacunación es la mejor intervención para la prevención de la enfermedad; sin embargo la protección que se adquiere por la vacunación (05 dosis) no es una protección de por vida, por lo que la población de adolescentes y adultos, en quienes los síntomas característicos de la enfermedad suelen presentarse como un resfriado común, son los potenciales transmisores de la tos ferina para los grupos de edad de riesgo como son los niños menores de dos meses de edad, gestantes y adultos mayores. De ahí la importancia de la detección oportuna de casos de tos ferina para la implementación de acciones de prevención y control. Actualmente el sistema nacional de vigilancia epidemiológica permite monitorear el proceso de notificación de casos de tos ferina con la finalidad de garantizar la captación e intervención oportuna de casos para prevenir y controlar los brotes por esta enfermedad. La actividad de notificación de casos de tos ferina en el Perú se encuentran normadas dentro de la Directiva Sanitaria N° 046 que establece la notificación de enfermedades y eventos sujetos a vigilancia epidemiológica en salud pública y el compendio de definiciones de caso de enfermedades y eventos sujetos a vigilancia epidemiológica emitida en el año 2011.
